

Burn's Taxonomy

Level	Tasks
Knowledge	<ul style="list-style-type: none"> • <i>retrieve points</i> • <i>locate value</i> • <i>identify axis labels</i>
Comprehension	<ul style="list-style-type: none"> • <i>summarize main message/take away</i> • <i>describe content of visualization</i> • <i>explain the topic of the visualization</i>
Application	<ul style="list-style-type: none"> • <i>use a percentage and total population to calculate a number</i> • <i>calculate the difference between two points</i> • <i>translate the data in a chart to a table</i>
Analysis	<ul style="list-style-type: none"> • <i>describe a trend</i> • <i>describe the relationship between two variables</i> • <i>identify what data was used to come to a conclusion</i>
Synthesis	<ul style="list-style-type: none"> • <i>predict a future value</i> • <i>generate a new visual representation</i>
Evaluation	<ul style="list-style-type: none"> • <i>justify a conclusion based on data</i> • <i>judge which design is more appropriate</i>

Revisions:

Revision	Justification
Renamed <i>retrieve points</i> to <i>retrieve value</i>	For clarity.
Renamed <i>identify axis labels</i> to <i>identify labels of scales</i>	"Scales" is broader and includes color legend.
Added make comparisons	It is a common visualization task from other task taxonomies and it is not in Burn's taxonomy.
Added identify range	It is a common visualization task from other task taxonomies and it is not in Burn's taxonomy.
Combined <i>summarize main message/take away</i> , <i>describe content of visualization</i> ,	All three are very similar to each other. Early experiments also showed that our pipeline

explain the topic of the visualization into <i>describe the topic of the visualization</i>	made very similar items for these tasks.
Renamed <i>use a percentage and total population to calculate a number to estimate the ratio of one value to another value of the same type</i>	For clarity and naming consistency with other “estimate value” tasks.
Renamed <i>calculate the difference between two points</i> to <i>estimate the difference between two values of the same type</i>	For clarity and naming consistency with other “estimate value” tasks.
Added <i>estimate the average of multiple values of the same type</i>	It is a common visualization task and it is not in Burn’s taxonomy.
Removed <i>translate the data in a chart to a table</i>	It is not suitable for the multiple-choice format.
Combined <i>describe a trend</i> and <i>describe the relationship</i> between two variables into <i>describe trend or correlation</i>	They are very similar to each other. Early experiments also showed that our pipeline made very similar items for these tasks.
Removed <i>identify what data was used to come to a conclusion</i>	This task is too vague and the items we and our (early stage) pipeline produced were similar to items with other tasks.
Removed <i>predict a future value</i>	The multiple-choice format requires an unambiguous correct answer, but making predictions involves uncertainty, so it is difficult to have one correct answer.
Changed <i>generate a new visual representation</i> to <i>describe the characteristics of an alternative chart type</i>	The multiple-choice format is not appropriate for asking people to generate a new visualization from scratch. Therefore, we modified the original task so that it suits the multiple-choice format. Describing what an alternative chart type looks like requires similar skills as the reader needs to generate a visual representation in their head and choose the corresponding answer.
Removed <i>justify a conclusion based on data</i>	This task is too vague and the items we and the (early stage) pipeline produced were similar to items with other tasks.
Split <i>judge which design is more appropriate</i> into <i>judge which visualization design is more appropriate for a task</i> and <i>judge which task this visualization design best supports</i>	They are sufficiently different.
